DETAILED ACTION

Response to Arguments

1. The Applicants' arguments and amendments filed on July 2, 2006 have been fully considered and are persuasive.

Allowable Subject Matter

2. *Claims 1-19 and 21 are allowed. The claims indicated include limitations that the prior arts of record do not appear to teach or render obvious, hence they are allowed.*
3. The following is an examiner's statement of reasons for allowance:

As presented in the previous Office Action, Podgorny et al. (US006078948A) teaches a system that "includes logic to establish communication connections with demons and logic to maintain system state, including a list of associations identifying demons in a room. It also includes logic to receive a message from a demon, to consult the system state, and, in response to the consultation, to forward a message to other relevant demons as determined by the system state" (Podgorny, col.2, lines 52-58). In addition, Podgorny discloses "a first and second client node may collaborate by causing their respective demons to send messages from a predefined protocol to the server, which in turn will forward them to other relevant demons" (Podgorny, abstract). According to Podgorny, the demon logic of a room "includes logic to receive messages from a launched application and ... forward the messages to the server. It also includes logic to receive messages from the server and to cause at least a portion of the message to be

routed to a relevant entity” (Podgorny, col.2, lines 45-49). In addition, figures 1 and 2 show that the launched applications can send messages to each others via the demon logic, which establishes the connections, and the server which stores and forwards the messages to the relevant entities. Hence, Podgorny discloses of a messaging system that receives messages from users via the system’s application demon and forwarding those messages to the intended users as appropriate. Also presented in the previous Office Action, Codella et al. (US006804818B1) discloses, “in JMS, a destination corresponds to a JMS destination, which in turn can be either a queue or a topic (for point-to-point and publish/subscribe, respectively)” (Codella, col.15, lines 61-63).

However, the prior arts of record fail to teach or suggest individually or in combination as stated in the independent claims for *“the message system comprising a server cluster containing a group of client manager nodes, said group of client manager nodes comprising a plurality of client manager nodes”, “the server cluster further containing a group of message manager nodes being configured differently from the client manager nodes, said group of message manager nodes comprising a plurality of message manager nodes”, “the system further comprising communication channel means for providing a multicast communication channel for forwarding messages between said group of client manager nodes and said group of message manager nodes”,* and in combination with other limitations as set forth in the independent claims, as well as Applicants’ arguments presented on pages 11-26 of the amendment filed on July 2, 2006.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany
